Porthos™
IoT platform

Our award-winning and industry-leading Porthos™ Software-as-a-Service platform provides billing, reporting, and support controls over your IoT solutions.

Porthos™ can be used across multiple carriers simultaneously, allowing our customers to connect to 20 different mobile operator partners around the globe – all on a single screen and a single bill. It is a cloud-based application hosted on our Wyless private network, ensuring maximum resilience, scalability, and security to millions of devices worldwide.

Whether you are a large multi-national organisation, reseller, SMB, or mobile network operator, Wyless can create a Porthos™ solution perfectly tailored to manage and deliver your IoT applications as efficiently as possible.

Key Features

Carrier Agnostic – Porthos™ is integrated with over 20 different mobile network operators, which allows our customers to manage all of their connections in one place. Leverage Wyless' buying power with any of these carriers and purchase connectivity through us at extremely competitive rates. Wyless open architecture also enables customers to 'bring your own carrier', (BYOC), all managed through Porthos™.

Device Agnostic – It doesn't matter if you have purchased your connected device through Wyless or if you want to bring your own device (BYOD), Porthos™ will still provide the powerful tools you need to effectively manage your equipment. In addition, Wyless can offer an e-commerce solution including forward and reverse logistics for consumption by your company, or your end-user.

White Label Capability – Porthos™ can be completely white labelled, allowing MNO's, resellers, and Application Service Providers to offer it as a value-added service. As a role-driven program, Porthos™ offers a multi-tiered experience which gives administrators the power to grant or restrict user permissions to perform particular functions.

Global Reach – Wyless has Virtual Data Centers (VDCs) around the world enabling us to scale our platform and embrace the growth of IoT. We can implement a 'dedicated instance' to help mitigate risk and satisfy regulatory and security requirements whilst providing near-premises access for our customers.

Freedom and Flexibility – Our customers have the ability to customize our IoT Platform. Take advantage of our multi-lingual offering, use custom fields to identify and group connections, or configure your reports to display exactly the information you need. Take advantage of our flexible billing system as well, which provides greater transparency and control for you and your customers by combining all of your connections onto one single bill.

Self Service – Save time and money with Porthos™' provisioning features that allow users to order new SIMs, activate connections, as well as suspend and restore existing connections without ever picking up the phone. You can also create support tickets via Porthos™, which will go directly through to our 3 tiers of global, multi-lingual support teams – available 24/7/365.

API Integration – The Wyless API allows you to embed useful data directly into your application and extend these features to your customers or internal teams. With industry standard protocols, the API is easy to integrate into almost any platform or system with no dependency on developer tools or specialised data transfer. Write once to a single API for all carriers.

Trusted Advisor – Be sure to leverage Wyless' expertise as the leading IoT solutions provider. Wyless will engage with your company regarding your strategic needs and share decades worth of M2M and IoT experience.

Private Network – Security is not an issue with Porthos™, as it is hosted on Wyless' geo-redundant private data network. This allows us to customize VPN tunnels with operators, IPSEC tunnels with devices, and faster-than-direct response times for custom carrier solutions.
